Package ‘BigKnn’

June 3, 2020

Type Package

Title Large Scale K-Nearest Neighbor Classifier using the Lucene Search Engine

Version 1.0.0

Date 2020-06-03

Maintainer Martijn Schuemie <schuemie@ohdsi.org>

Description A large scale k-nearest neighbor classifier using the Lucene search engine.

Imports rJava,
Andromeda (>= 0.3.0),
dplyr,
rlang

Suggests testthat

R topics documented:

`buildKnn` *Build a K-nearest neighbor (KNN) classifier*

Description

`buildKnn` loads data from two Andromeda tables, and inserts them into a KNN classifier.

Usage

```
buildKnn(outcomes, covariates, indexFolder, overwrite = TRUE)
```

Arguments

`outcomes`	An Andromeda table containing the outcomes with predefined columns (see below).
`covariates`	An Andromeda table containing the covariates with predefined columns (see below).
`indexFolder`	Path to a local folder where the KNN classifier index can be stored.
`overwrite`	Automatically overwrite if an index already exists?

Details

These columns are expected in the outcome object:

rowId	(integer)	Row ID is used to link multiple covariates (x) to a single outcome (y)
y	(real)	The outcome variable

These columns are expected in the covariates object:

rowId	(integer)	Row ID is used to link multiple covariates (x) to a single outcome (y)
covariateId	(integer)	A numeric identifier of a covariate
covariateValue	(real)	The value of the specified covariate

Value

Nothing

`buildKnnFromPlpData` *Build a K-nearest neighbor (KNN) classifier from a plpData object*

Description

Build a K-nearest neighbor (KNN) classifier from a plpData object

Usage

```
buildKnnFromPlpData(
  plpData,
  population,
  indexFolder,
  overwrite = TRUE,
  cohortId = NULL,
  outcomeId = NULL
)
```

Arguments

`plpData`	An object of type `plpData`.
`population`	The population.
`indexFolder`	Path to a local folder where the KNN classifier index can be stored.
`overwrite`	Automatically overwrite if an index already exists?
`cohortId`	The ID of the specific cohort for which to fit a model.
`outcomeId`	The ID of the specific outcome for which to fit a model.

`predictKnn` *Predict using a K-nearest neighbor (KNN) classifier*

Description

`predictKnn` uses a KNN classifier to generate predictions.

Usage

```
predictKnn(
  cohorts,
  covariates,
  indexFolder,
  k = 1000,
  weighted = TRUE,
  threads = 1
)
```

Arguments

`cohorts`	An Andromeda table containing the cohorts with predefined columns (see below).
`covariates`	An Andromeda table containing the covariates with predefined columns (see below).
`indexFolder`	Path to a local folder where the KNN classifier index can be stored.
`k`	The number of nearest neighbors to use to predict the outcome.
`weighted`	Should the prediction be weighted by the (inverse of the) distance metric?
`threads`	Number of parallel threads to used for the computation.

Details

These columns are expected in the covariates object:

rowId	(integer)	Row ID is used to link multiple covariates (x) to a single outcome (y)
covariateId	(integer)	A numeric identifier of a covariate
covariateValue	(real)	The value of the specified covariate

This column is expected in the covariates object:

rowId	(integer)	Row ID is used to link multiple covariates (x) to a single outcome (y)

Value

A data.frame with two columns:

rowId	(integer)	Row ID is used to link multiple covariates (x) to a single outcome (y)
prediction	(real)	A number between 0 and 1 representing the probability of the outcome

---

predictKnnUsingPlpData

Create predictive probabilities using KNN.

Description

Create predictive probabilities using KNN.

Usage

```
predictKnnUsingPlpData(
  plpData,
  population,
  indexFolder,
  k = 1000,
  weighted = TRUE,
  threads = 10
)
```

Arguments

`plpData`	An object of type `plpData` as generated using `getDbPlpData`.
`population`	The population to predict for.
`indexFolder`	Path to a local folder where the KNN classifier index is be stored.
`k`	The number of nearest neighbors to use to predict the outcome.
`weighted`	Should the prediction be weigthed by the (inverse of the) distance metric?
`threads`	Number of parallel threads to used for the computation.

Details

Generates predictions for the population specified in plpData.

Value

The value column in the result data.frame is: logistic: probabilities of the outcome, poisson: Poisson rate (per day) of the outcome, survival: hazard rate (per day) of the outcome.
